Tile production line improvements

ACTIVE TERMINAL

SACMI for efficiency

The new Automatic Adjustment System makes setting up the APB powder loading terminal much faster and more precise: LEAP INTO THE FUTURE WITH REAL-TIME SLAB DENSITY ADJUSTMENT.

Reduced Downtime

ADVANTAGES

- Terminal can be adjusted without any machine downtime
- Better safety: the terminal no longer needs to be physically removed from the machine
- Real-time slab density adjustment during line operation

Tile production line improvements

ACTIVE TERMINAL

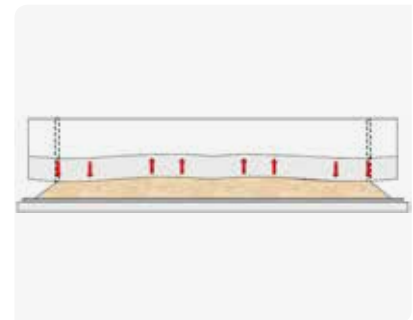

Technical features

Manual adjustment of the distributor opening is replaced by automatic adjustment of the active terminal.

The new device monitors and adjusts powder loading from the APB to the Continua+ belt, ensuring perfect slab stratification and density at all times. A big step forwards for line efficiency.

A set of electric actuators performs real-time control while sophisticated software allows powder loading during production without any need for further line stoppages.
